PRACTICAL: - 5.1

AIM: - PHP based web application to understand data retrieval on server side.

PHP + HTML CODE: -

```
<!DOCTYPE html>
<html>
<head>
   <title>PHP Data Retrieval</title>
</head>

<body>

   <h2>PHP Server Side Data Retrieval</h2>

   <form method="post">

      Enter Your Name:
      <input type="text" name="name">

      <br><br>

      Enter Your College:
      <input type="text" name="college">

      <br><br>
```

```
 <input type="submit" name="submit" value="Submit">

   </form>

   <?php

   if (isset($_POST["submit"])) {

      $name = $_POST["name"];
      $college = $_POST["college"];

      echo "<h3>Retrieved Data:</h3>";
      echo "Name: " . $name . "<br>";
      echo "College: " . $college;
   }

   ?>

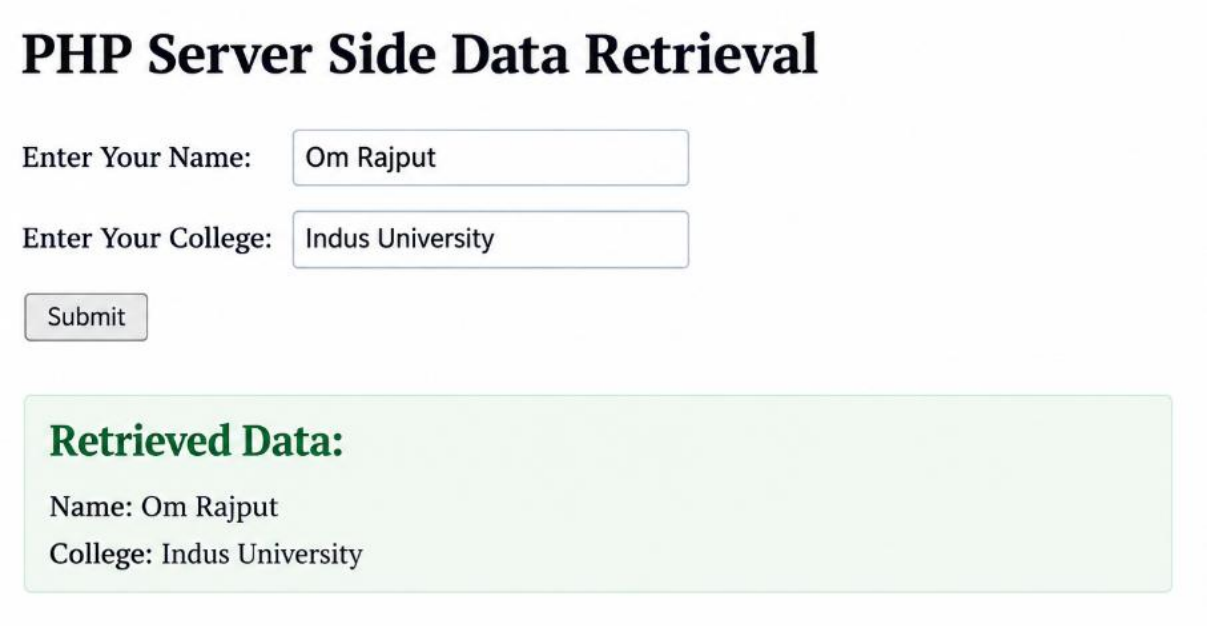

</body>
</html>
```

INPUT: -

Name: Om Rajput

College: Indus University

OUTPUT: -

WORKING: -

- The user enters **Name** and **College** in the HTML form.
- The method="post" sends the entered data to the server.
- $_POST["name"] retrieves the name from the submitted form.
- $_POST["college"] retrieves the college name.
- PHP processes the data on the **server side**.
- The retrieved data is displayed using echo.

RESULT: -

Thus, the PHP-based web application was successfully executed to retrieve and display user-entered data on the server side.
